

DIVA.EXCHANGE

Results of the Research: «Trying to De-Anonymize I2P Network Participants»

...and its Relation to Crypto Swaps involving XMR

About diva.exchange

- Non profit association, open to everyone
- A loose bunch of Devs & Researchers
- What: create a fully private and truly distributed exchange for digital values – some call this «swaps»... we just want to make it useful for humans and bots
- No centralized business model (pointless)

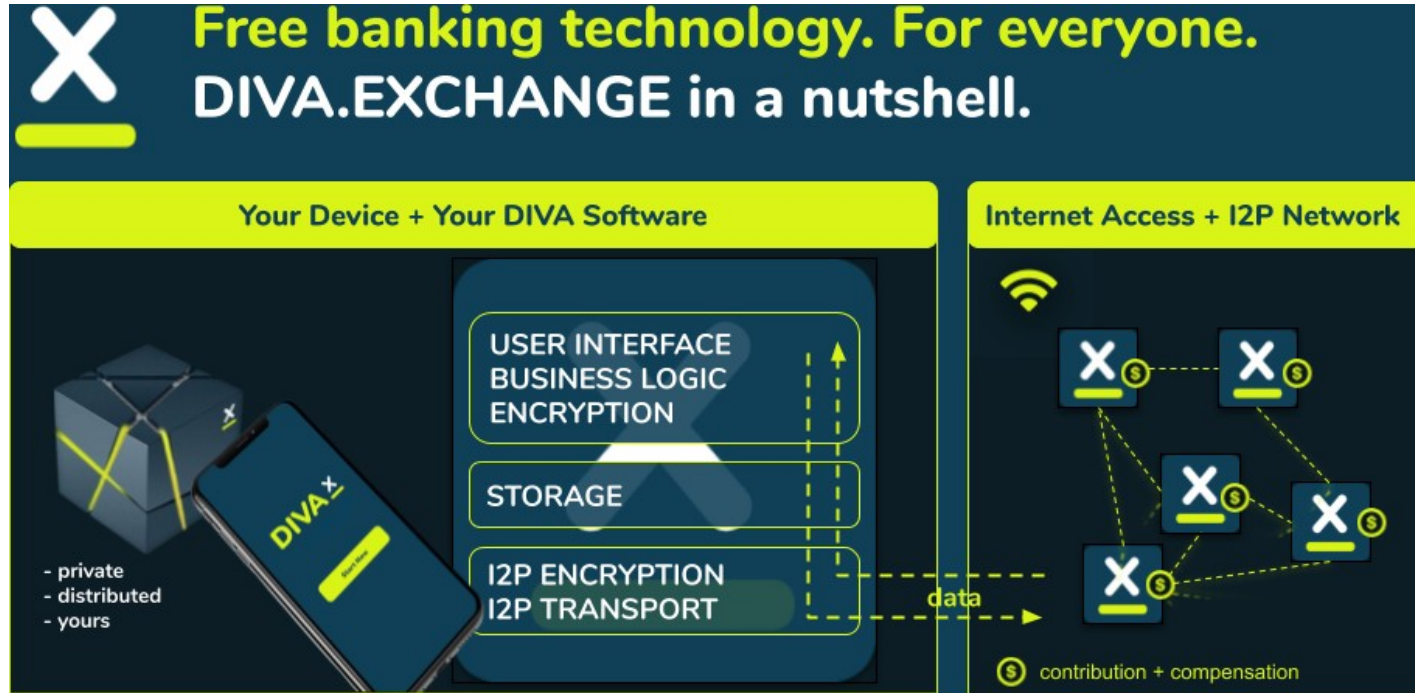

Agenda

- Intro (you are here!)
- Project status: Exchange («swaps»)
- Marco Purtschert presenting I2P Research Results
- Outro & Q&A

Scope

What we did as Devs...

- Created an I2P SAM library as generic communication helper via I2P for any application: `npm i @diva.exchange/i2p-sam`
- From scratch: PBFT/PoS - weighted byzantine fault tolerance - based blockchain, divachain: `npm i @diva.exchange/divachain`
- The diva protocol prototype to handle the exchange functionality («swaps»... call it whatever you want, it is just the fully distributed «business logic»)
- An UI prototype («diva»)
- Dockerized environment for the full stack (I2P, divachain, protocol, UI)

Current State

- Divachain works great over I2P (UDP gossip)
- Examples: XMR, BTC and ETH are smooth experiences as a Dev (like: as asset backends over I2P with separated wallets)
- Research together with universities

Next Challenges

- Dev: First trades (aka «swaps») involving XMR, BTC, ETH and probably some others
- Research: Trying to de-anonymize «swaps», trying to break divachain, scalability of divachain

Focus on I2P

- Marco Purtschert and Brian Boss are the researchers at Lucerne University of Applied Sciences and Arts
- diva.exchange is the research partner (definition of scope and alike) – but not interfering (also not financially)
- Following Video is the teaser done by Marco & Brian
